

**Supplementary Figure 1.** Positive controls of 3,3-diaminobenzidine immunohistochemical staining for PRR [(A), brown)], ACE [(B), brown)], ATIIR1 [(C), brown)], and ATIIR2 [(D), brown)] demonstrated the expected staining patterns in human placenta, kidney, liver and kidney respectively. The negative control on a liver metastasis from colon adenocarcinoma sample using an IgG isotype [(E), brown)] demonstrated no staining. Nuclei were counter-stained with hematoxylin [(A-E), blue]. Original magnification: 400x.
