The Canine IO panel was developed specifically for use with paraffin-embedded canine tumor tissue from canine cancer patients through a collaboration at the PRe-medical Cancer Immunotherapy Network for Canine Trials (PRECINCT) and Nanostring Technologies and supported by a grant from the National Institute (U24-CA224122 SUPPLEMENT; PI: Nicola Mason). Genes known to be associated with intracranial gliomas in both pet dogs and humans were selected on their relevance for the study of oncology as well as expression profiles from both RNA-Seq and nCounter experiments.
